Dear Kavya,

Thank you for the technical check on our manuscript, “**ARMOR-FL: Anytime-Valid Robust Martingale-Based Online Reweighting for Federated Intrusion Detection**” (Manuscript ID 36ffcd3-31c3-4d49-8e4a-df0d92256555). We have revised the manuscript to address both formatting points raised and are resubmitting it through the portal.

Single-column format. The manuscript now compiles with the `sn-jnl` class in single-column mode (the `iicol` double-column option has been removed).

25-page limit. The single-column reflow alone would have pushed the manuscript to 44 pages, well over the limit, so meeting it required more than a formatting change. We moved six appendices – the full per-combination result and detection-statistic tables, the reproducibility checklist, a worked numerical example, the notation summary, and the baseline aggregation pseudocode – into a separate Electronic Supplementary Material file (also enclosed), referenced from the main text’s Declarations section. We then condensed the prose throughout the paper for concision. No results, numbers, citations, or claims were changed or removed in this process; the trimming was confined to wording, and the supplementary file preserves everything moved out of the main text in full. The manuscript now compiles to 24 pages.

We have not made any other changes to the manuscript’s content, methods, results, or conclusions. Please let us know if any further adjustment is needed.

Thank you for your time and consideration.

Sincerely,

Quang-Vinh Dang
